tick sound/ red line when correctly copied, cross out sound/ red line + write in what is said if incorrectly copied, cross out line + write NR (No Response) if not copied at all.

Red line: the likely threshold if the sound was copied when presented at normal voice level. It could be better than this but that is all that this test has demonstrated.

The F₂ of “oo” does not need to be heard for the child to hear “oo” (may be identified by hearing only the F₁)

All other sounds are presented as loud as when used at the beginning of a word eg “Sue”
